Design Patterns And Layers As you start moving beyond basic design patterns, you will need to know about the Layers in a web application. In any web application a few layers are common in our application. The layers are as follows: Back-end Data access layer Http request layer Back-end Data presentation layer Front-end UI presentation layer Layers should be defined based on their functionality and should be loosely coupled. It should also be made clear what can be used for specific layers. Make sure you use a validator library that validates the data sent from the layer above.
